

Assignment_1: Swager api link enhancement

Ask: Act as a senior architect and understand the entire project to do some enhancements

Plan: I want to enhance the application to accept swagger link as a input . [Strictly follow]- I should have 2 radio buttons on the top of the page under the Upload Swagger specification
1.Link 2.File upload

If i select on the link radio button then a new text field should appear to paste the link or enter the link and proceed with the rest of the functionalities

Application should validate the link and if the link format is fine then generate the test cases should be visisble for the user to go through the rest of the functions

when clciking the file upload radio button the default placeholder which is present now to upload files should appear and the user should able to upload files and continue rest of the functionalities

[Strict] whithout selecting an button it should not show any functionality Example : It is showing drop your Swagger file here as a default functionality when the application is getting loaded

[STRICT]The rest of the functionalities to geneerate the test cases from the swagger link also same as Generating test cases through the file upload

Do not break the existing implementation to generate test cases using the yaml/json file for swagger

Analyse the impacted files and plan and come with the plan for this enhancement .

After i review and Approve then implement in agent mode

Agent: Implement the enhancement

Output:

The screenshot displays the Testleaf API Testcase Generator web application. At the top, the Testleaf logo and 'API Testcase Generator' are visible, along with a 'Clear' button. The main heading is 'Generate reliable API testcases from Swagger'. Below this, a workflow diagram shows steps: 01 Upload, 02 Validate, 03 Generate, and 04 Export. A sub-header 'STEP 1' is followed by 'Upload Swagger specification'. The instruction 'Choose how you want to provide your OpenAPI specification.' is followed by two radio button options: 'Link' (with a text field for 'Paste a hosted Swagger URL') and 'File upload' (with a text field for 'Upload YAML, YML, or JSON'). The 'Link' option is currently selected.

Assignment_2:

Enhance the existing application by implementing a feature that automatically categorizes the generated test cases into standard testing types such as Smoke, Sanity, Regression, Functional.

Once the test cases are generated, the application should classify each test case into the most appropriate category and display the categorized results in a structured and user-friendly format

The new functionality should seamlessly integrate with the existing test case generation workflow without impacting current features

Output:
